

MedicScribe

An AI medical scribe for Malaysian clinics

by Sunkarilabs

Data Sovereignty · Zero-Cloud Liability · Specialized Medical Intelligence

MedicScribe lets your doctors **speak naturally with the patient** while the AI writes the clinical note. One button to start, one to stop — a clean, structured SOAP note appears on screen seconds later, ready to review, edit, and export.

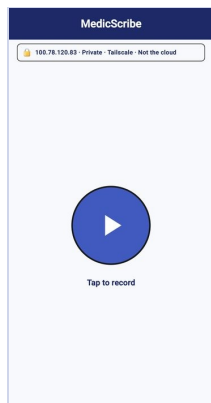

It is **working and field-tested today**. The screenshots in this document are from the live app.

The clinical value

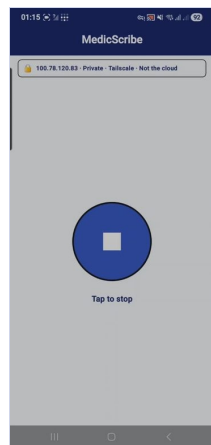

- **Gives time back.** Less typing during and after the visit means more attention on the patient and a faster clinic.
- **Speaks how Malaysia speaks.** Built on speech-recognition models tuned for Malaysian multilingual consultations — English, Malay, Mandarin and Tamil, plus local **dialects and everyday slang (Manglish)**, even mixed in the same sentence — and still produces a clean **English** note.
- **Structured and ready.** Notes come back in the familiar Subjective / Objective / Assessment / Plan format, captured straight from the conversation.

MedicScribe is powered by highly advanced, localized enterprise AI models that scale seamlessly based on your clinic's volume and simultaneous user requirements.

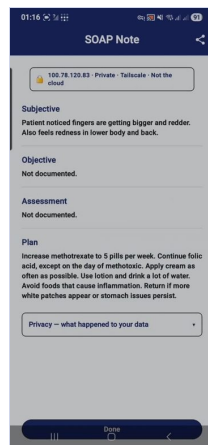

See it in action

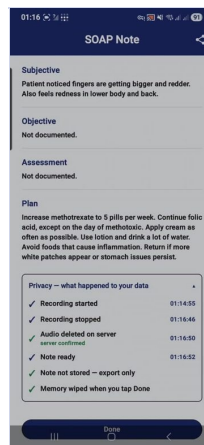

1. **Start** — one button, and a banner reminding you the data is private, not the cloud.

2. **Recording** — the button becomes Stop. Nothing else to manage.

3. **The note** — a ready SOAP note you can edit and Share.

4. **Privacy trail** — proof of exactly what happened to the data.

In this real example, MedicScribe captured the patient's complaint and a detailed medication plan from a two-minute conversation, and the note was ready a few seconds after Stop.

Private by design — zero cloud, zero liability

Most medical scribes send the recording to a company's servers on the internet. For patient data, that is a permanent liability. MedicScribe never does.

- **Data sovereignty.** The audio and the note live only on a private machine you control — no cloud account, no foreign data centre, no vendor holding your records.
- **Zero-cloud liability.** Nothing leaves the building, so there is no cloud breach surface to be liable for — a clean answer for PDPA 2010.
- **Proof, every time.** The app shows that the audio was deleted, the note is export-only, and everything is wiped when the doctor taps Done.

The sealed "black box"

MedicScribe runs on a sealed, **headless** AI appliance — no screen, no desktop, nothing for staff to open, configure, or break. It is locked down and fully automated.

- **Zero tinkering, zero maintenance** for your clinic staff — it simply runs.
- **Engineered for uptime** — no software clutter, so virtually nothing to go wrong.
- **Nothing to lose.** If it is ever interrupted, no consultation data is lost — your team just carries on.

Fits your clinic's devices: MedicScribe is fully compatible with both iPad (iOS) and Android tablets, seamlessly integrating into your clinic's existing hardware preference.

Next step — collaborative trial deployment

Every clinic group has a unique layout, device preference, and consultation volume. **Sunkarilabs works closely with your team to customise a pilot deployment** that seamlessly integrates with your branch workflow — delivered within **30 days** of requirement finalisation.

Tell us your branch layout, device preference, and rough consultation volume, and we will shape a pilot around it. The next move is yours.
